Performance of a novel serological test for the diagnosis of Mycoplasma genitalium infection in women seeking care in obstetric clinics. Treatment of Mycoplasma genitalium infection is recommended in cases with cervicitis and sequelae like PID or UTI, but evidence is scarce. A novel, quantitative, immunochromatographic assay for the detection of M. genitalium antigen in urine is available. We evaluated the performance of this assay for the detection of M. genitalium infection in women attending an obstetric clinic and compared it to a validated urine-based real-time polymerase chain reaction assay (PGS-test), detecting a 400 bp sequence in the M. genitalium lacZ operon. Urine was collected from 499 women (mean age 28.5 years) and screened for M. genitalium infection using the PGS-test and the novel assay. A total of 76 (15.3%) patients had an M. genitalium infection detected by either test. Compared to PGS-test positive women, test performance was slightly inferior for the detection of M. genitalium infection, with a sensitivity of 81.1% (95% confidence interval (CI): 71.4-88.7%) versus 85.9% (95% CI: 76.2-93.3%), a specificity of 84.1% (95% CI: 79.2-88.8%) versus 94.5% (95% CI: 92.2-95.9%), a positive predictive value (PPV) of 83.8% (95% CI: 76.6-90.1%) versus 89.0% (95% CI: 83.9-93.2%) and a negative predictive value (NPV) of 83.8% (95% CI: 76.6-90.1%) versus 91.6% (95% CI: 87.0-95.0%) respectively. This assay may be a valuable point-of-care test in the initial evaluation of women presenting with cervicitis.

1. Technical Field

The present invention relates to a semiconductor device, a display device, a method of manufacturing a semiconductor device, and a method of manufacturing a display device, and in particular, to an organic EL display f678ea9f9e
